Pedigree based match probability results

Match probabilities

Type	Probability	Iterations	Model probabilities
Average pedigree probability[1]	4.4003E-05	225,000	4.4614E-05, 4.3447E-05, 4.3950E-05
Inside match probability[2]	• 1: 2.5049E-01 • 0: 7.4951E-01	150,000	2.5088E-01, 2.5088E-01, 2.4970E-01

There is a **25%** probability that at least one other (non-excluded) unknown individual in this pedigree matches the suspect haplotype.

Likelihood Ratio (LR) = It is **0.334** times more likely that the suspect is the only individual in this pedigree carrying the suspect haplotype, compared to the alternative that at least one other untyped individual in the pedigree also carries it.

Disclaimer: The match probabilities shown above are the result of a stochastic (randomized) simulation. Due to the nature of Monte Carlo sampling, results may vary slightly between independent simulation runs, even when using the same input parameters.

[1] The average pedigree probability is the probability of the current state of the pedigree, i.e. with all typed and untyped haplotypes.
[2] The inside match probability is the probability that at least one other (non-excluded) unknown individual in this pedigree matches the suspect haplotype.

Per individual match probability

Individual	Match probability
2	24.9%
5	13.9%
7	0.00695%

Individual	Match probability
3	0.00573%
6	0.00458%

Performance Metrics

- Run time pedigree probability: 0:01:08.283600
- Run time proposal distribution: 0:01:51.071128
- Run time extended pedigree: 0:00:00.000596
- Run time outside match: 0:00:00.000013
- Total run time: 0:02:59.355379
- Total needed iterations: 375,000
