Trace Donor Identification Report

Analysis Name: mock-fo

Analyst: fo2025

Date: 2025-12-11 16:34

Trace Mode Analysis
This report identifies the most likely trace donor from the pedigree individuals based on Y-STR haplotype matching. The probabilities below have been normalized to sum to 100% across all pedigree members (including outside pedigree probability).

Summary

5
Total Options Analyzed

Trace Donor Match Probabilities (Normalized)

The following table shows the normalized match probability for each individual in the pedigree plus the outside pedigree probability. Probabilities are ranked from highest to lowest, with the most likely trace donor at the top.

Rank	Individual ID	Match Probability (%)
1	**Verdachte**	**99.2884%**
2	M-1478	**0.2864%**
3	M-8462	**0.2614%**
4	Outside Pedigree	**0.1575%**
5	M-2853	**0.0062%**

Interpretation

Most Likely Donor: Individual **Verdachte** has the highest normalized match probability of **99.2884%**.

> **Strong Evidence:** The most likely donor has a probability exceeding 50%, suggesting relatively strong evidence that this individual (or outside pedigree source) is the trace donor.

Note: These probabilities represent relative likelihoods and include the possibility of an unrelated individual (Outside Pedigree). If "Outside Pedigree" has the highest probability, the trace donor is more likely to be someone not in the analyzed pedigree.
